

Radio Assisted Toilet Alarm System

Simple Installation

Units are Self Contained

Sophisticated radio technology for extended range

The Technical Alarm Systems Radio Assisted Toilet Alarm system is designed to provide a fully featured system, giving a central monitoring point for multiple toilets within a building to meet the needs of the Disabilities Discrimination Act in all public buildings at an economical cost.

The installation of this type of system is very simple, requiring only two screws to fix each unit in its required place, with a mains power supply only being required where the display panel is sited.

The units run on self contained battery power, with a long life battery and automatic battery monitoring. When the battery requires replacing the overdoor light/sounder will beep to indicate which unit has sent the battery low signal.

Having no wiring connecting the units makes the kit extremely flexible. The units can easily be moved as required and extra units can be added at any time.

Booster panels are available to increase the range of the system.
